### COMPLETE SPECIFICATION ACCEPTED

Notice is hereby given that any person interested in opposing the grant of a patent on any of the applications concerned, may, at any time within four months from the date of this issue or within such further period not exceeding one month if applied for on Form 4 prescribed under the Patent (Amendment) Rules, 1999 before the expiry of the said period of four months, give notice to the Controller of Patents at the appropriate office on the prescribed Form 7 of such opposition. The written statement of opposition should be filed in duplicate along with evidence, if any, with said notice or within sixty days of its date as prescribed in Rule 36 as amended by the Patents (Amendment) Rules, 1999.

The Classification given below in respect of each specification are according to Indian Classification and International Classification Systems.

Printed copies of the specification and drawings, if any, can be supplied by the Patent Office or its branch offices on payment of prescribed charges of Rs. 30/- each.

In the event of non-availability of printed specification, photocopies of the specification and drawings, if any, can be supplied by the Patent Office and its branch offices on payment of prescribed photocopy charges @ Rs. 10/- per page of such document plus Rs. 30/-.

### स्वीकृत संपूर्ण विनिर्देश

in a single reactor comprising.

- reacting a solution of Bromoacid in a water immiscible polar/non-polar solvent with an acidic catalyst of the kind herein described and removing water by azeotropic distillation to complete lactonization and to get a solution of bromolactone in the solvent.
- removing the said acidic catalyst from the above solution by washing it with an aqueous bicarbonate/carbonate solution.
- concentrating the resulting solution to remove residual water azeotropically, followed by partial removal of the solvent to get a solution of predetermined concentration of Bromolactone in the solvent.
- reacting the above solution of Bromolactone in the solvent with zinc and 90% aqueous acetic acid solution to get crude Deltamethric acid, and
- purifying the crude Deltamethric acid via its sodium salt in a known manner to get pure Deltamethric acid, wherein the above steps, instead of being carried out in separate reactors, are carried out in the same single reactor to be economical and environmental friendly.

A process for preparing Deltamethrin ((S)- $\alpha$ -Cyano-3-phenoxybenzyl-(1R,3R)-3-(2',2'-dibromovinyl)-2,2-dimethylcyclopropanecarboxylate) from Hemiacetal comprising:

step 1- adding simultaneously Hemiacetal and bromoform from separate addition points to a solution of an alkali metal hydroxide in an alcohol along with an organic ether such as tetrahydrofuran (THF), at  $-10^{\circ}\text{C}$  to  $0^{\circ}\text{C}$ , stirring the reaction mass at low temperature until the completion of the reaction, diluting the mixture with water, recovering the solvent mixture at  $60-80^{\circ}\text{C}/760$  mm Hg for re-use, dissolving the alkali metal salt of the Bromoacid by addition of required amount of water, extracting the impurities with a water immiscible polar/non-polar solvent, acidifying the aqueous mass with mineral acid to pH 2, and isolating the precipitated Bromoacid either by filtration or by extraction with a water immiscible polar/non-polar solvent,

step 2- heating a solution of the said Bromoacid in a polar/non-polar solvent and p-toluene sulfonic acid (PTSA) at  $80$  to  $120^{\circ}\text{C}$  in a known manner and continuously removing water to form Bromolactone, removing the PTSA using 2-5% aqueous alkali metal carbonate/bi-carbonate solution followed by azeotropic water removal and then partial solvent stripping under reduced pressure ( $70-75^{\circ}\text{C}/350-600$  mm Hg) to have a solution of the Bromolactone of a known concentration in the solvent,

step 3- adding aqueous acetic acid to a solution of the said Bromolactone in the solvent, stirring at  $25+5^{\circ}\text{C}$ , then adding zinc powder in a known manner and stirring until the reaction is complete, diluting the reaction mixture with water, extracting the crude Deltamethric acid (DMA) with a water immiscible polar/non-polar solvent, adding aqueous alkali metal hydroxide solution to the said solvent layer to extract DMA as its alkali metal salt, acidifying the said alkali metal salt solution with aqueous mineral acid to pH 2 and isolating the precipitated DMA by filtration or by extraction with a water immiscible polar/non-polar solvent followed by removal of the solvent under reduced pressure,

said steps 2 and 3, are carried out in single reactor to save infrastructure and energy

step 4- preparing Deltamethric acid chloride from said DMA by reacting it with thionyl chloride and a catalyst, dimethyl formamide, reacting the said acid chloride with sodium cyanide and meta-phenoxy benzaldehyde to get crude Deltamethrin along with R-diastereoisomer and epimerising the mixture to Deltamethrin in iso-propanol in the presence of a base, tri-ethyl amine, at  $20-25^{\circ}\text{C}$  for 20-30 hours in a known manner and isolating pure Deltamethrin by filtration followed by drying.

A process for the production of saturated compounds from mono olefinic compounds, diolefinic and /or acetylenic compounds comprising the steps of :

- (a) feeding (1) a hydrocarbon stream containing mono olefinic compounds, diolefinic and /or acetylenic compounds and (2) a second stream containing hydrogen to distillation reaction column;
- (b) concurrently contacting said streams in a distillation reaction zone with a hydrogenation catalyst of the kind herein defined at an effectuating hydrogen partial pressure in the range of from 0.1 psia to less than 70 psia at a temperature in the range of 40 to 300°F, said hydrogenation catalyst being a component of a distillation structure thereby selectively hydrogenating said mono olefinic compounds, diolefinic and/or acetylenic compounds to form saturated compounds in partial liquid phase.

A process for the preparation of porous, crystalline tin-containing molecular sieve catalyst having formula in terms of mole ratios of oxides in the an anhydrous state :

Wherein  $w = 0.0003$  to  $0.03$ ;  $x = 0$  to  $(0.035 - w)$  and  $y = 1 - w - x$ , the said catalyst characterized by an x-ray diffraction pattern and physico-chemical properties such as herein described and the said process comprises the steps of :

- forming a complex by mixing a source of silicon, a source of tin in the presence or absence of aluminium source and an agent selected from acetylacetone, tartarate, citrate or oxy-anion, which is capable to form complex with silicon and tin source, at a pH below 4;
- adding a nitrogen containing organic compound preferably tetrapropyl ammonium having nitrogen containing group  $\text{R}_4\text{N}^+$ , where  $\text{R}_4$  represents an alkyl group having 2 to 5 carbon atoms to obtain a gel;
- autoclaving the resultant gel at autogeneous pressure and at a temperature in the range of  $100-200^\circ\text{C}$  under static or rotating condition for 10 to 72 hrs, followed by quenching, filtering, washing, drying and then calcining the dried material at a temperature in the range of  $400-600^\circ\text{C}$  for a period of 12-24 hours to gel the porous crystalline tin containing molecular sieve catalyst.

- an electromagnetic coil having a central passageway adapted for receiving a hollow core and having a pair of electrical terminals adapted for connection to a controllable source of electric power, said core being fixedly positioned in said coil and having a first end extending outward from a first end of said coil;
- a frame attached to said end of said core, said frame having a portion extending on an outer surface of said coil to a second end opposite said first end of said coil;
- a moveable armature pivotably coupled to said frame adjacent said second end of said coil, said armature being positioned for attraction to said second end of said core upon energization of said coil;
- an air flow control valve attached to said frame adjacent said first end of said core and aligned axially with said core, said control valve including a housing having, in combination :

an air inlet port adapted for connection to a source of relatively high pressure air;

an air outlet port adapted for supplying air from said inlet port to an air controlled mechanism;

an air exhaust port adapted for exhausting air from said outlet port to external of said housing;

a central aperture passing through said housing and aligned axially with said core, said aperture having a first enlarged diameter section at a first end of said housing adjacent said core, a second enlarged diameter section adjacent a second end of the said housing opposite said first end and third reduced diameter section interconnecting said first and second sections, said inlet port being coupled to said second section, said outlet port being coupled to said third section and said exhaust port being coupled to said first section;

a first resilient seal positioned on said first valve seat;

a second valve seat formed in said aperture at a transition from said second section to said third section;

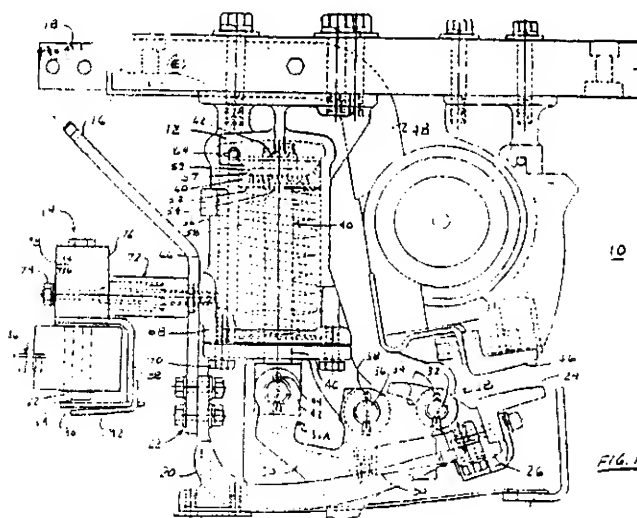

a second resilient seal positioned on said second valve seat;

a valve stem extending through said hollow core and into said first section of said aperture in said valve housing;

means operatively associated with said valve stem for seatingly engaging said first resilient seal upon energization of said coil in reaction to said armature urging said valve stem toward said valve for coupling air from said inlet port to said outlet port;

a valve stem extension extending from said second section of said aperture through said third section and into engagement with said valve stem; and

means operatively associated with said valve stem extension for seatingly engaging said second resilient seal upon de-energization of said coil for decoupling said inlet port from said outlet port and concurrently coupling said outlet port to said exhaust port.
